

# TMP100-EP DIGITAL TEMPERATURE SENSOR WITH I<sup>2</sup>C INTERFACE

SGLS254B – JULY 2005 – REVISED OCTOBER 2013

- **Controlled Baseline**
  - One Assembly/Test Site, One Fabrication Site
- **Enhanced Diminishing Manufacturing Sources (DMS) Support**
- **Enhanced Product-Change Notification**
- **Qualification Pedigree<sup>†</sup>**
- **Digital Output: I<sup>2</sup>C Serial 2-Wire**
- **Resolution: 9- to 12-Bits, User Selectable**
- **Accuracy:  $\pm 2^{\circ}\text{C}$  from  $-25^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  (MAX),  $\pm 3^{\circ}\text{C}$  from  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  (MAX)**

<sup>†</sup> Component qualification in accordance with JEDEC and industry standards to ensure reliable operation over an extended temperature range. This includes, but is not limited to, Highly Accelerated Stress Test (HAST) or biased 85/85, temperature cycle, autoclave or unbiased HAST, electromigration, bond intermetallic life, and mold compound life. Such qualification testing should not be viewed as justifying use of this component beyond specified performance and environmental limits.

- **Low Quiescent Current: 45  $\mu\text{A}$ , 0.1- $\mu\text{A}$  Standby**
- **Wide Supply Range: 2.7 V to 5.5 V**
- **Small SOT23-6 Package**

## applications

- **Power-Supply Temperature Monitoring**
- **Computer Peripheral Thermal Protection**
- **Notebook Computers**
- **Battery Management**
- **Thermostat Controls**
- **Environmental Monitoring**
- **Electromechanical Device Temperature**

## description/ordering information

The TMP100 and TMP101 are 2-wire, serial output temperature sensors available in SOT23-6 packages. Requiring no external components, the TMP100 and TMP101 are capable of reading temperatures with a resolution of 0.0625°C.

The TMP100 and TMP101 feature SMBus and I<sup>2</sup>C™ interface compatibility, with the TMP100 allowing up to eight devices on one bus.

The TMP100 and TMP101 are ideal for extended temperature measurement in a variety of communication, computer, consumer, environmental, industrial, and instrumentation applications.

The TMP100M and TMP101M are specified for operation over a temperature range of  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

<sup>‡</sup> Product Preview

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications. These devices have limited built-in ESD protection.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

I<sup>2</sup>C is a registered trademark of Philips Incorporated.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

# TMP100-EP DIGITAL TEMPERATURE SENSOR WITH I<sup>2</sup>C INTERFACE

SGLS254B – JULY 2005 – REVISED OCTOBER 2013

## functional block diagram

## absolute maximum ratings over operating free-air temperature range (unless otherwise noted)<sup>†</sup>

|                                                      |                 |
|------------------------------------------------------|-----------------|
| Supply voltage, V <sub>+</sub>                       | 7.5 V           |
| Input voltage range                                  | –0.5 V to 7.5 V |
| Operating free-air temperature range, T <sub>A</sub> | –55°C to 125°C  |
| Storage temperature range, T <sub>stg</sub>          | –60°C to 150°C  |
| Maximum Junction temperature, T <sub>J</sub>         | 150°C           |
| Thermal impedance, θ <sub>JA</sub> (See Note 1)      | 165°C/W         |
| Lead temperature soldering                           | 300°C           |

<sup>†</sup> Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: The thermal impedance, θ<sub>JA</sub>, for the DBV package is determined for JEDEC high-K PCB (JESD 51–7).

## recommended operating conditions

# TMP100-EP

## DIGITAL TEMPERATURE SENSOR

### WITH I<sup>2</sup>C INTERFACE

SGLS254B – JULY 2005 – REVISED OCTOBER 2013

## APPLICATION INFORMATION

The TMP100 and TMP101 are digital temperature sensors optimal for thermal management and thermal protection applications. The TMP100 and TMP101 are I<sup>2</sup>C and SMBus interface compatible and are specified over a temperature range of –55°C to +125°C.

The TMP100 and TMP101 require no external components for operation except for pullup resistors on SCL, SDA, and ALERT although a 0.1-μF bypass capacitor is recommended, as shown in Figure 1.

NOTE 2: SCL and SDA require pullup resistors for I<sup>2</sup>C bus applications.

**Figure 1. Typical Connections of the TMP100**

The die flag of the lead frame is connected to pin 2. The sensing device of the TMP100 and TMP101 is the chip itself. Thermal paths run through the package leads as well as the plastic package. The lower thermal resistance of metal causes the leads to provide the primary thermal path. The GND pin of the TMP100 or TMP101 is directly connected to the metal lead frame and is the best choice for thermal input.

To maintain the accuracy in applications requiring air or surface temperature measurement, care should be taken to isolate the package and leads from ambient air temperature. A thermally conductive adhesive assists in achieving accurate surface temperature measurement.

### pointer register

Figure 2 shows the internal register structure of the TMP100 and TMP101. The 8-bit pointer register of the TMP100 and TMP101 is used to address a given data register. The pointer register uses the two LSBs to identify which of the data registers should respond to a read or write command. Table 1 identifies the bits of the pointer register byte. Table 2 describes the pointer address of the registers available in the TMP100 and TMP101. Power-up reset value of P1/P0 is 00.

**Figure 2. Internal Register Structure of TMP100 and TMP101**

## DIGITAL TEMPERATURE SENSOR

### WITH I<sup>2</sup>C INTERFACE

SGLS254B – JULY 2005 – REVISED OCTOBER 2013

## APPLICATION INFORMATION

### temperature register

The temperature register of the TMP100 or TMP101 is a 12-bit read-only register that stores the output of the most recent conversion. Two bytes must be read to obtain data and are described in Table 3 and Table 4. The first 12 bits are used to indicate temperature with all remaining bits equal to zero. Data format for temperature is summarized in Table 5. Following power-up or reset, the temperature register reads 0°C until the first conversion is complete.

**Table 5. Temperature Data Format**

The user can obtain 9, 10, 11, or 12 bits of resolution by addressing the configuration register and setting the resolution bits accordingly. For 9, 10, or 11 bit resolution, the most significant bits in the temperature register are used with the unused LSBs set to zero.

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

## APPLICATION INFORMATION

### configuration register

The configuration register is an 8-bit read/write register used to store bits that control the operational modes of the temperature sensor. Read/write operations are performed MSB first. The format of the configuration register for the TMP100 and TMP101 is shown in Table 6, followed by a breakdown of the register bits. The power-up/reset value of the configuration register is all bits equal to 0. The OS/ALERT bit will read as 1 after power-up/reset.

| Byte | D7       | D6 | D5 | D4 | D3 | D2  | D1 | D0 |
|------|----------|----|----|----|----|-----|----|----|
| 1    | OS/ALERT | R1 | R0 | F1 | F0 | POL | TM | SD |

**Table 6. Configuration Register Format**

### shutdown mode (SD)

The shutdown mode of the TMP100 and TMP101 allows the user to save maximum power by shutting down all device circuitry other than the serial interface, which reduces current consumption to less than 1  $\mu$ A. For the TMP100 and TMP101, shutdown mode is enabled when the SD bit is 1. The device shutsdown once the current conversion is completed. For SD equal to 0, the device maintains continuous conversion.

### thermostat mode (TM)

The thermostat mode bit of the TMP101 indicates to the device whether to operate in comparator mode (TM = 0) or interrupt mode (TM = 1). For more information on comparator and interrupt modes, see the *high and low limit registers* and *SMBus alert function* sections.

### polarity (POL)

The polarity bit of the TMP101 allows the user to adjust the polarity of the ALERT pin output. If POL = 0, the ALERT pin will be active low as shown in Figure 3. For POL = 1, the ALERT pin will be active high and the state of the ALERT pin is inverted.

**Figure 3. Output Transfer Function Diagrams**

# TMP100-EP

## DIGITAL TEMPERATURE SENSOR

### WITH I<sup>2</sup>C INTERFACE

SGLS254B – JULY 2005 – REVISED OCTOBER 2013

## APPLICATION INFORMATION

### fault queue (F1/F0)

A fault condition occurs when the measured temperature exceeds the limits set in the  $T_{HIGH}$  and  $T_{LOW}$  registers. Additionally, the number of fault conditions required to generate an alert may be programmed using the fault queue. The fault queue is provided to prevent a false alert due to environmental noise and requires consecutive fault measurements to trigger the alert function. Table 7 defines the number of measured faults that may be programmed to trigger an alert condition.

| F1 | F0 | CONSECUTIVE FAULTS |
|----|----|--------------------|
| 0  | 0  | 1                  |
| 0  | 1  | 2                  |
| 1  | 0  | 4                  |
| 1  | 1  | 6                  |

Table 7. Fault Settings of the TMP100 and TMP101

### converter resolution (R1/R0)

The converter resolution bits control the resolution of the internal analog-to-digital (A/D) converter. This allows the user to maximize efficiency by programming for higher resolution or faster conversion time. Table 8 identifies the resolution bits and relationship between resolution and conversion time.

| R1 | R0 | RESOLUTION         | CONVERSION TIME<br>(Typical) |
|----|----|--------------------|------------------------------|
| 0  | 0  | 9 Bits (0.5°C)     | 40 ms                        |
| 0  | 1  | 10 Bits (0.25°C)   | 80 ms                        |
| 1  | 0  | 11 Bits (0.125°C)  | 160 ms                       |
| 1  | 1  | 12 Bits (0.0625°C) | 320 ms                       |

Table 8. Resolution of the TMP100

### os/alert (OS)

The TMP100 and TMP101 feature a one-shot temperature measurement mode. When the device is in shutdown mode, writing a 1 to the OS/ALERT bit starts a single temperature conversion. The device returns to the shutdown state at the completion of the single conversion. This is useful to reduce power consumption in the TMP100 and TMP101 when continuous monitoring of temperature is not required.

Reading the OS/ALERT bit provides information about the comparator mode status. The state of the POL bit will invert the polarity of data returned from the OS/ALERT bit. For  $POL = 0$ , the OS/ALERT reads as 1 until the temperature equals or exceeds  $T_{HIGH}$  for the programmed number of consecutive faults, causing the OS/ALERT bit to read as 0. The OS/ALERT bit continues to read as 0 until the temperature falls below  $T_{LOW}$  for the programmed number of consecutive faults when it again reads as 1. The status of the TM bit does not affect the status of the OS/ALERT bit.

## APPLICATION INFORMATION

### high and low limit registers

In comparator mode (TM = 0), the ALERT pin of the TMP101 becomes active when the temperature equals or exceeds the value in T<sub>HIGH</sub> and generates a consecutive number of faults according to fault bits F1 and F0. The ALERT pin remains active until the temperature falls below the indicated T<sub>LOW</sub> value for the same number of faults.

In Interrupt Mode (TM = 1) the ALERT Pin becomes active when the temperature equals or exceeds T<sub>HIGH</sub> for a consecutive number of fault conditions. The ALERT pin remains active until a read operation of any register occurs or the device successfully responds to the SMBus Alert Response Address. The ALERT pin will also be cleared if the device is placed in Shutdown Mode. Once the ALERT pin is cleared, it will only become active again by the temperature falling below T<sub>LOW</sub>. When the temperature falls below T<sub>LOW</sub>, the ALERT pin becomes active and remains active until cleared by a read operation of any register or a successful response to the SMBus Alert Response Address. Once the ALERT pin is cleared, the above cycle repeats with the ALERT pin becoming active when the temperature equals or exceeds T<sub>HIGH</sub>. The ALERT pin can also be cleared by resetting the device with the General Call Reset command. This also clears the state of the internal registers in the device returning the device to Comparator Mode (TM = 0).

The ALERT pin function for both operational modes is represented in Figure 3. Table 9 and Table 10 describe the format for the T<sub>HIGH</sub> and T<sub>LOW</sub> registers. Power-up reset values for T<sub>HIGH</sub> and T<sub>LOW</sub> are: T<sub>HIGH</sub> = 80°C and T<sub>LOW</sub> = 75°C. The format of the data for T<sub>HIGH</sub> and T<sub>LOW</sub> is the same as for the temperature register.

All 12 bits for the temperature, T<sub>HIGH</sub>, and T<sub>LOW</sub> registers are used in the comparisons for the ALERT function for all converter resolutions. The three LSBs in T<sub>HIGH</sub> and T<sub>LOW</sub> can affect the ALERT output even if the converter is configured for 9-bit resolution.

## DIGITAL TEMPERATURE SENSOR

### WITH I<sup>2</sup>C INTERFACE

SGLS254B – JULY 2005 – REVISED OCTOBER 2013

## APPLICATION INFORMATION

### serial interface

The TMP100 and TMP101 operate only as slave devices on the I<sup>2</sup>C bus and SMBus. Connections to the bus are made via the open-drain I/O lines SDA and SCL. The TMP100 and TMP101 support the transmission protocol for fast (up to 400 kHz) and high-speed (up to 3.4 MHz) modes. All data bytes are transmitted most significant bit first.

### serial bus address

To program the TMP100 and TMP101, the master must first address slave devices via a slave address byte. The slave address byte consists of seven address bits and a direction bit indicating the intent of executing a read or write operation.

The TMP100 features two address pins to allow up to eight devices to be addressed on a single I<sup>2</sup>C interface. Table 11 describes the pin logic levels used to properly connect up to eight devices. *Float* indicates the pin is left unconnected. The state of pins ADD0 and ADD1 is sampled on the first I<sup>2</sup>C bus communication and should be set prior to any activity on the interface.

| ADD1  | ADD0  | SLAVE ADDRESS |
|-------|-------|---------------|
| 0     | 0     | 1001000       |
| 0     | Float | 1001001       |
| 0     | 1     | 1001010       |
| 1     | 0     | 1001100       |
| 1     | Float | 1001101       |
| 1     | 1     | 1001110       |
| Float | 0     | 1001011       |
| Float | 1     | 1001111       |

**Table 11. Address Pins and Slave Addresses for TMP100**

The address pins of the TMP100 and TMP101 are read after reset or in response to an I<sup>2</sup>C address acquire request. Following a read, the state of the address pins is latched to minimize power dissipation associated with detection.

---

## APPLICATION INFORMATION

### bus overview

The device that initiates the transfer is called a *master* and the devices controlled by the master are *slaves*. The bus must be controlled by a master device that generates the serial clock (SCL), controls the bus access, and generates the START and STOP conditions.

To address a specific device, a START condition is initiated, indicated by pulling the data-line (SDA) from a high-to-low logic level while SCL is high. All slaves on the bus shift in the slave address byte, with the last bit indicating whether a read or write operation is intended. During the ninth clock pulse, the slave being addressed responds to the master by generating an acknowledge and pulling SDA low.

Data transfer is then initiated and sent over eight clock pulses followed by an acknowledge bit. During data transfer, SDA must remain stable while SCL is high, as any change in SDA while SCL is high will be interpreted as a control signal. Once all data has been transferred, the master generates a STOP condition indicated by pulling SDA from low-to-high, while SCL is high.

### writing/reading to the TMP100 and TMP101

Accessing a particular register on the TMP100 and TMP101 is accomplished by writing the appropriate value to the pointer register. The value for the pointer register is the first byte transferred after the I<sup>2</sup>C slave address byte with the R/ $\overline{W}$  bit low. Every write operation to the TMP100 and TMP101 requires a value for the pointer register. (See Figure 5.)

When reading from the TMP100 and TMP101, the last value stored in the pointer register by a write operation is used to determine which register is read by a read operation. To change the register pointer for a read operation, a new value must be written to the pointer register. This is accomplished by issuing an I<sup>2</sup>C slave address byte with the R/ $\overline{W}$  bit low, followed by the pointer register byte. No additional data is required. The master can then generate a START condition and send the I<sup>2</sup>C slave address byte with the R/ $\overline{W}$  bit high to initiate the read command. See Figure 6 for details of this sequence. If repeated reads from the same register are desired, it is not necessary to continually send the pointer register bytes as the TMP100 and TMP101 remembers the pointer register value until it is changed by the next write operation.

### slave mode operations

The TMP100 and TMP101 can operate as slave receivers or slave transmitters.

#### *slave receiver mode*

The first byte transmitted by the master is the slave address, with the R/ $\overline{W}$  bit low. The TMP100 or TMP101 then acknowledges reception of a valid address. The next byte transmitted by the master is the pointer register. The TMP100 or TMP101 then acknowledges reception of the pointer register byte. The next byte or bytes are written to the register addressed by the pointer register. The TMP100 and TMP101 acknowledge reception of each data byte. The master may terminate data transfer by generating a START or STOP condition.

#### *slave transmitter mode*

The first byte is transmitted by the master and is the slave address, with the R/ $\overline{W}$  bit high. The slave acknowledges reception of a valid slave address. The next byte is transmitted by the slave and is the most significant byte of the register indicated by the pointer register. The master acknowledges reception of the data byte. The next byte transmitted by the slave is the least significant byte. The master acknowledges reception of the data byte. The master may terminate data transfer by generating a not-acknowledge on reception of any data byte, or generating a START or STOP condition.

# TMP100-EP DIGITAL TEMPERATURE SENSOR WITH I<sup>2</sup>C INTERFACE

SGLS254B – JULY 2005 – REVISED OCTOBER 2013

## APPLICATION INFORMATION

### SMBus alert function

The TMP101 supports the SMBus Alert function. When the TMP101 is operating in Interrupt Mode (TM = 1), the ALERT pin of the TMP101 may be connected as an SMBus Alert signal. When a master senses that an ALERT condition is present on the ALERT line, the master sends an SMBus Alert command (00011001) on the bus. If the ALERT pin of the TMP101 is active, the TMP101 acknowledges the SMBus Alert command and responds by returning its slave address on the SDA line. The eighth bit (LSB) of the slave address byte indicates if the temperature exceeding  $T_{HIGH}$  or falling below  $T_{LOW}$  caused the ALERT condition. For POL = 0, this bit will be LOW if the temperature is greater than or equal to  $T_{HIGH}$ . This bit will be HIGH if the temperature is less than  $T_{LOW}$ . The polarity of this bit will be inverted if POL = 1. See Figure 7 for details of this sequence.

If multiple devices on the bus respond to the SMBus Alert command, arbitration during the slave address portion of the SMBus alert command determines which device clears its ALERT status. If the TMP101 wins the arbitration, its ALERT pin becomes inactive at the completion of the SMBus Alert command. If the TMP101 loses the arbitration, its ALERT pin remains active.

The TMP100 also responds to the SMBus ALERT command if its TM bit is set to 1. Since it does not have an ALERT pin, the master needs to periodically poll the device by issuing an SMBus Alert command. If the TMP100 has generated an ALERT, it acknowledges the SMBus Alert command and returns its slave address in the next byte.

### general call

The TMP100 and TMP101 respond to the I<sup>2</sup>C General Call address (0000000) if the eighth bit is 0. The device acknowledges the general call address and responds to commands in the second byte. If the second byte is 00000100, the TMP100 and TMP101 latch the status of their address pins, but will not reset. If the second byte is 00000110, the TMP100 and TMP101 latch the status of their address pins and reset their internal registers.

### high-speed mode

In order for the I<sup>2</sup>C bus to operate at frequencies above 400 kHz, the master device must issue an Hs-mode master code (00001XXX) as the first byte after a START condition to switch the bus to high-speed operation. The TMP100 and TMP101 will not acknowledge this byte as required by the I<sup>2</sup>C specification, but switch their input filters on SDA and SCL and their output filters on SDA to operate in Hs-mode, allowing transfers at up to 3.4 MHz. After the Hs-mode master code has been issued, the master transmits an I<sup>2</sup>C slave address to initiate a data transfer operation. The bus continues to operate in Hs-mode until a STOP condition occurs on the bus. Upon receiving the STOP condition, the TMP100 and TMP101 switch their input and output filters back to fast-mode operation.

### timing diagrams

The TMP100 and TMP101 are I<sup>2</sup>C and SMBus compatible. Figure 4 through Figure 7 describe the various operations on the TMP100 and TMP101. Bus definitions are given below. Parameters for Figure 4 are defined in Table 12.

**Bus Idle:** Both SDA and SCL lines remain high.

**Start Data Transfer:** A change in the state of the SDA line, from high-to-low, while the SCL line is high, defines a START condition. Each data transfer is initiated with a START condition.

**Stop Data Transfer:** A change in the state of the SDA line from low-to-high while the SCL line is high defines a STOP condition. Each data transfer is terminated with a repeated START or STOP condition.

**Data Transfer:** The number of data bytes transferred between a START and a STOP condition is not limited and is determined by the master device. The receiver acknowledges the transfer of data.

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

## APPLICATION INFORMATION

**Acknowledge:** Each receiving device, when addressed, is obliged to generate an acknowledge bit. A device that acknowledges must pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable low during the high period of the acknowledge clock pulse. Setup and hold times must be taken into account. On a master receive, the termination of the data transfer can be signaled by the master generating a not-acknowledge on the last byte that has been transmitted by the slave.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
